

Ingegneria Sismica e Progettazione Strutturale

Probabilistic Seismic Risk Analysis for Civil Systems

Ph.D. Student Chiara Nardin – M.Sc., Eng. in Civil Engineering
Prof. Marco Broccardo – Ph.D., M.Sc., Eng. in Civil Engineering

Outline

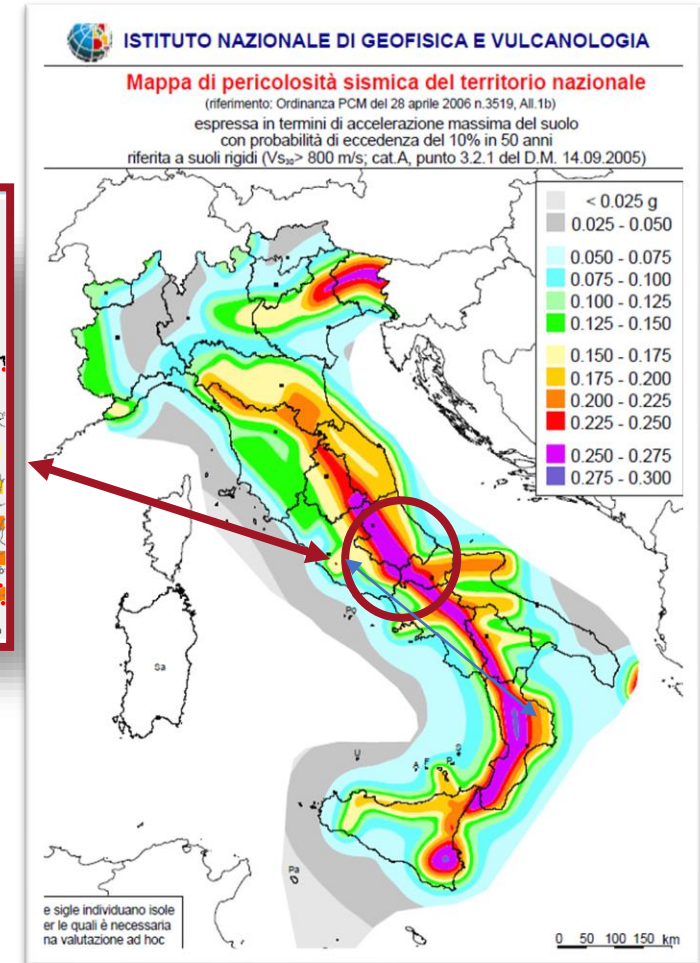

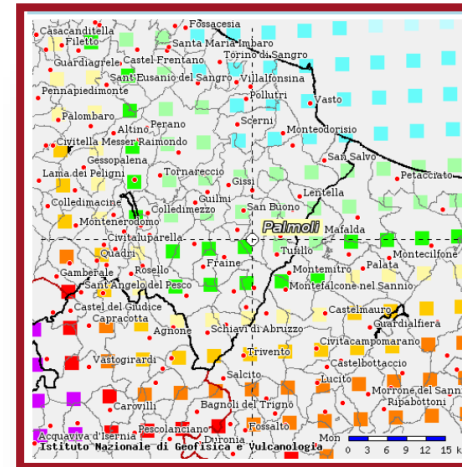

Seismic Risk

PBEE-PEER Framework

Lecture Plan

Outline:

- Motivations: earthquake and losses
- Hazard curves and fragility functions
- PBEE-PEER framework
- Lecture Plan

seismic risk

«Con la parola rischio si intende esprimere un concetto generale che comprende sia la probabilità di un evento, sia le conseguenze che l'evento stesso potrebbe produrre.»

Fondamenti di ingegneria sismica in 80 lezioni, A.Parducci, Liguori Ed.

«Risk has been defined, for management purposes, as the potential economic, social and environmental consequences of hazardous events that may occur in a specified period of time. »

Seismic risk evaluation for an urban centre, M.L.Carreno, O.D.Cardona, A.H.Barbat, 250th Anniversary of the 1755 Lisbon Earthquake

seismic risk \neq seismic hazard

«La pericolosità sismica corrisponde alla frequenza delle intensità dei terremoti che si prevede possano interessare il territorio in questione. Può essere definita come la probabilità che un evento potenzialmente dannoso si manifesti in questo territorio entro un determinato periodo di tempo.»

Fondamenti di ingegneria sismica in 80 lezioni, A.Parducci, Liguori Ed.

«A seismic hazard is the probability that an earthquake will occur in a given geographic area, within a given window of time, and with ground motion intensity exceeding a given threshold. »

Probabilistic seismic hazard analysis: Early history, McGuire, R. Earthquake Engng Struct. Dyn., 2008

Complete Damage

PBEE-PEER framework

PBEE: Performance Based Earthquake Engineering

PBEE concept: seismic performance objectives vs seismic hazard level. ©Poland et al.,(1995)-*Vision 2000: Performance Based Earthquake Engineering of buildings*. Structural Engineers Association of California, Sacramento, CA.

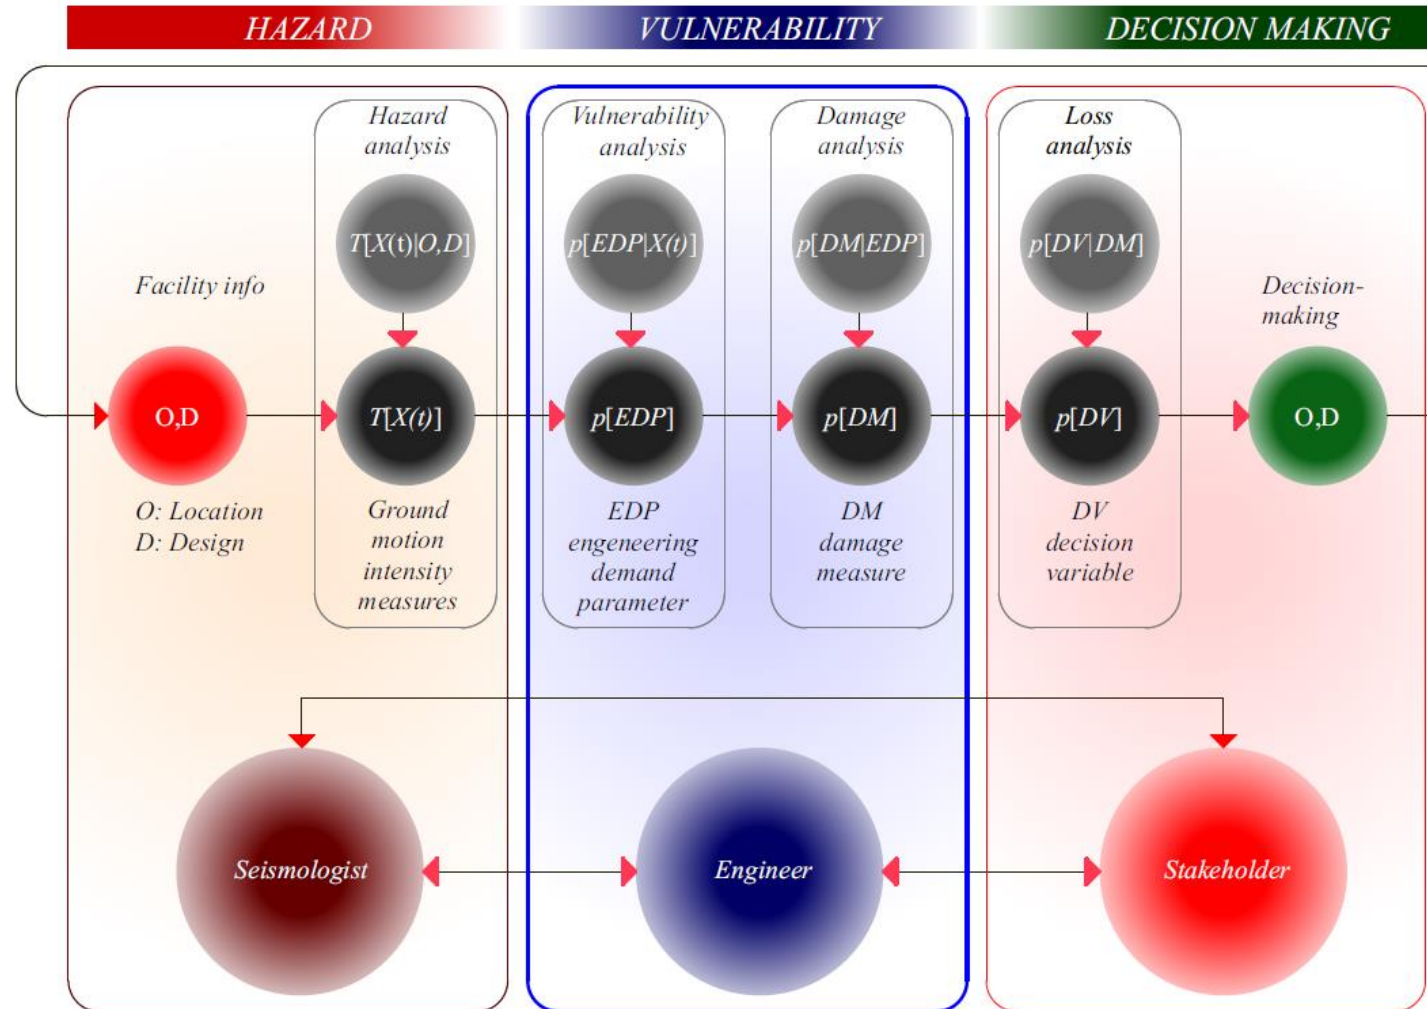

The **PEER-PBEE** Framework

$$IM \longrightarrow EDP \longrightarrow DM \longrightarrow DV$$

$$\lambda(dv) = \int_d \int_{edp} \int_{im} G(dv|d) |dG(d|edp)| |dG(edp|im)| |d\lambda(im)|$$

where im is an intensity measure (e.g., peak ground acceleration, peak ground velocity, spectral acceleration, etc.), edp is an engineering demand parameter (e.g., interstorey drift), d is a damage measure (e.g., minor, medium, extensive, collapse), dv is a decision variable (e.g., monetary losses, fatalities, etc.), $\lambda(x)$ is the mean annual rate of events exceeding a given threshold

for a given variable x , and $G(y|x) = P(Y \geq y|X = x)$ is the conditional complementary cumulative distribution function (CCDF)

Objectives & Lecture Plan:

- (1h30) Element of statistics and probability (M.Broccardo)
 - i. Set theory
 - ii. Random variables
 - iii. Probability distributions
- (1h00) Probabilistic seismic hazard (C.Nardin)
 - i. Definition and time scales
 - ii. Models of earthquake occurrence and hazard integral
 - iii. LAB → PSHA with MatLab
- (2h00) Vulnerability (M.Broccardo, C.Nardin)
 - i. Logistic regression models
 - ii. Fragility functions: methods and applications
 - iii. LAB → Computation of probability of damage state of a building
